MISCELLANEOUS: The enzyme has a temperature optimum of 85 degree: Celsius and a pH optimum of 7.0.
SIMILARITY: BELONGS TO FAMILY 16 OF GLYCOSYL HYDROLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  J. Biochem. 224:923-930(1994).
FUNCTION: SHOWS ACTIVITY ON LICHENAN, BETA-GLUCAN
BUT NOT ON CMC CELLULOSE OR XYLAN.

Recombinant coelomic cytolytic factor i (rCCF-1) is trypanolytic for the African trypanosome Trypanosoma brucei in a dose-dependent manner. The trypanolytic activity of rCCF-1 can be inhibited by antl-CCF-1 and anti-tumour necrosis factor (TNF)/TIP monoclonal antibodies. Furthermore, N,N'-diacetlychitobiose inhibits potently trypanolytic activity of rCCF-1. These data corroborate the findings that CCF-1 shares a trypanolytic, lectin-like domain with TNF-alpha. CCF-1 is useful to treat trypanosomal or bacterial infections or cancer. The proteins and peptides are also useful in tumour therapy, inflammation and other areas of immunology. The annelid peptide is derived from a 42 kDa cytolytic protein named CCF-1 that binds ilpopolysaccharide and beta-1,3-glucan. The factor resembles the vertebrate tumour necrosis factor-alpha (TNF-alpha), and may be used as

                                                                                                                                          This sequence comprises the polypeptide precursor of a novel Coerskovia xanthineolytica enzyme that exhibits beta-1,3-glucanase (BG) activity. Its amino acid sequence was deduced from an isolated genomic DNA sequence (see AAT89157). Claimed DNA constructs that encode the novel BG (see Also AAW29455), a mannose binding domain (see AAW29456), can be used to produce recombinant BG polypeptides, with or without a mannose binding domain, in fungal construction of acterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby cended amount of contaminants. They can also be used for the production of e.g. pigments, colourants, flavourants, yeast extracts, pharmaceuticals, food or feed compositions, and to

```

This sequence comprises the polypeptide precursor of a novel Oerskovia xanthineolytica enzyme that exhibits beta-1,3-glucanase (BG) activity and which includes a mannose binding domain (MBD). Its amino acid sequence was deduced from an isolated genomic DNA sequence (see AAT89156). Claimed DNA constructs that encode the novel BG lacking a MBD (see AAW29455 and AAW29457), a MDB (see

BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the production of e.g. pigments, colourants, flavourants, yeast extracts, pharmaceuticals, food or feed compositions, and to prepare protoplasts for use in fusion, transformation and cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW29458),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     enzyme that exhibits beta-1,3-glucanase (BG) activity. Its amino acid sequence was deduced from an isolated genomic DNA sequence (see AAT89155). Claimed DNA constructs that encode the novel BG also AAW29456 for corrected sequence), a mannose binding domain (see AAW29456), can be used to produce recombinant BG polypeptides, with or without a mannose binding domain, in fungal or bacterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the

The protein was isolated from the haemolymph of fifth stage B.mori larvae after injection with Enterobacter cloacae strain 57-9. Partial amino acid sequence was used to generate PCR primers (AAT10280-1). These amplified a fragment of the gene used as a probe to obtain the full length gene (AAT10879) by screening a cDNA llbrary derived from B.mori previously injected with heat-killed E.cloacae. The protein or fragments of it, can be used to treat diseases associated with LPS complexes e.g. septic shock, to remove LPS from products used for injection and to protect transgenic plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI;

```

This is the amino acid sequence of the full length lipopolysaccharide (LPS) binding protein from Bombyx mori. The protein was isolated from the haemolymph of fifth stage B.mori larvae after injection with Enterobacter cloacae strain 57-9. Partial amino acid sequence was used to generate PCR primers (AAT10280-1). These amplified a fragment of the gene used as a probe to obtain the full length gene by screening a CDNA library derived from B.mori previously injected with heat-killed E.cloacae. The protein or fragments of it, can be used to treat diseases associated with LPS complexes e.g. septic shock, to remove LPS from

products used for

injection and to protect transgenic plants r potato, against fungal infections.

The new enzyme is derived from alkaoplhilic Bacillus Sp. The enzyme acts on beta-1,3-glucans to form glucose and laminaribiose. It is stable over a wide pH range with opt. activity at weakly actidic pH and has good heat resistance.

Its amino acid sequence was deduced from a genomic DNA sequence (AAR29043) isolated from an O. xanthineolytica library. Recombinant beta-1,3-glucanase can be produced on a large scale using transformed host cells, esp. Bacillus subtilis DN1885 or ToC46. Protease-free beta-1,3-glucanase can be obtd. that is useful for Lysing fungal cell walls, allowing recovery of intracellular proteins. The enzyme is also useful for the prepn. of protoplasts and for the prodn. of pigments, colorants, flavours, yeast extract
                                                                                                                                                                                                                 ABB61180;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA construct encoding enzyme with beta-1,3-glucanase activity - useful for modifying or degrading beta-glucan contg. material and the prepn. of e.g. food colourants, flavourings and yeast extracts
                                                                                                                                                                                                                                                 ABB61180

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10151), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          23-MAR-2000;

The ENDO-A protein can be used in conjugation with alpha-N-acetylgalactosaminidase to remove externally and internally linked A antigen on group Al erythrocytes. The resulting erythrocytes may be transfused into individuals who would be otherwise unable to safely tolerate a transfusion of type Al blood. The ENDO-A protein can also be used to degrade keratan sulphate (e.g. in the food industry), or in blood typing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated endo-beta-galactosidase - from Flavobacterium keratolyticus, used particularly for de-antigenising human erythrocytes bearing Al antigen for blood transfusions.

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG176-ABL30511).
                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABLIG511), expressed DNA sequences (ABLIG176-ABLIG511), expressed DNA sequences (ABLIG176-ABLIG511).
                                                                         The sequence data for this patent did not form specification, but was obtained in electronic f at ftp.wipo.int/pub/published_pct_sequences.
